L4 PROBLEM 9 (5/5 points)

Write a Python function, `odd`, that takes in one number and returns `True` when the number is odd and `False` otherwise.

You should use the `%` (mod) operator, not `if`.

This function takes in one number and returns a boolean.

```
1 def odd(x):  
2     '''  
3     x: int or float.  
4     '''  
5     return (x % 2 == 1)  
6
```

Correct

```
def odd(x):  
    '''  
    x: int or float.  
    '''  
    return (x % 2 == 1)
```

Test results
